

I find it hard to beleive that PLC is even being considered. We already have enough poorly designed consumer electronic devices that emit enough RF polution as it is. Wide area interference from the power company is NOT acceptable. It's hard enough to get power companies to fix interference from street lights and cracked insulators. My self and other amateur operators are active in a number of emergency communication services (ARES, RACES, MARS) and already experience RFI interference from power lines and other equipment, to pursue PLC service would in effect shut us down and elimiate a valuable service to the community at large.

I strongly urge the FCC to bypass this option for broadband internet access.
